

# Chapter 5 Planning for Security

Begin with the end in mind.

STEPHEN COVEY, AUTHOR OF SEVEN  
HABITS OF HIGHLY EFFECTIVE PEOPLE

PRINCIPLES OF INFORMATION  
SECURITY

Second Edition

## Introduction

- ✿ Creation of information security program includes:
  - ✦ Creation of *policies, standards, and practices*, selection or creation of information security architecture and the development
  - ✦ Use of a detailed information security *blueprint* creates plan for future success
  - ✦ Creation of *contingency planning* consisting of incident response planning, disaster recovery planning, and business continuity plans
- ✿ Without policy, blueprints, and planning, organization is unable to meet information security needs of various communities of interest

# *Information Security Policy, Standards and Practices*

- ✚ Communities of interest must consider policies as basis for all information security efforts
- ✚ Policies direct how issues should be addressed and technologies used
- ✚ Security policies are least expensive controls to execute but most difficult to implement
- ✚ Shaping policy is difficult

# *Shaping Policy Difficult*

- ✚ Never conflict with laws
- ✚ Standup in court if challenged
- ✚ Be properly administered through dissemination and documented acceptance

# *Policy*

- ❖ Plan or course of action
- ❖ Convey instructions
- ❖ Organizational laws
- ❖ Dictate acceptable and unacceptable behavior

# *Policy*

## ✚ Define

- ✚ What is right
- ✚ What is wrong
- ✚ The appeal process
- ✚ What are the penalties for violating policy

## ✚ Written to support the mission, vision and strategic plan of organization

## ✚ For a policy to be effective, must be properly disseminated, read, understood and agreed to by all members of organization

# *Standards*

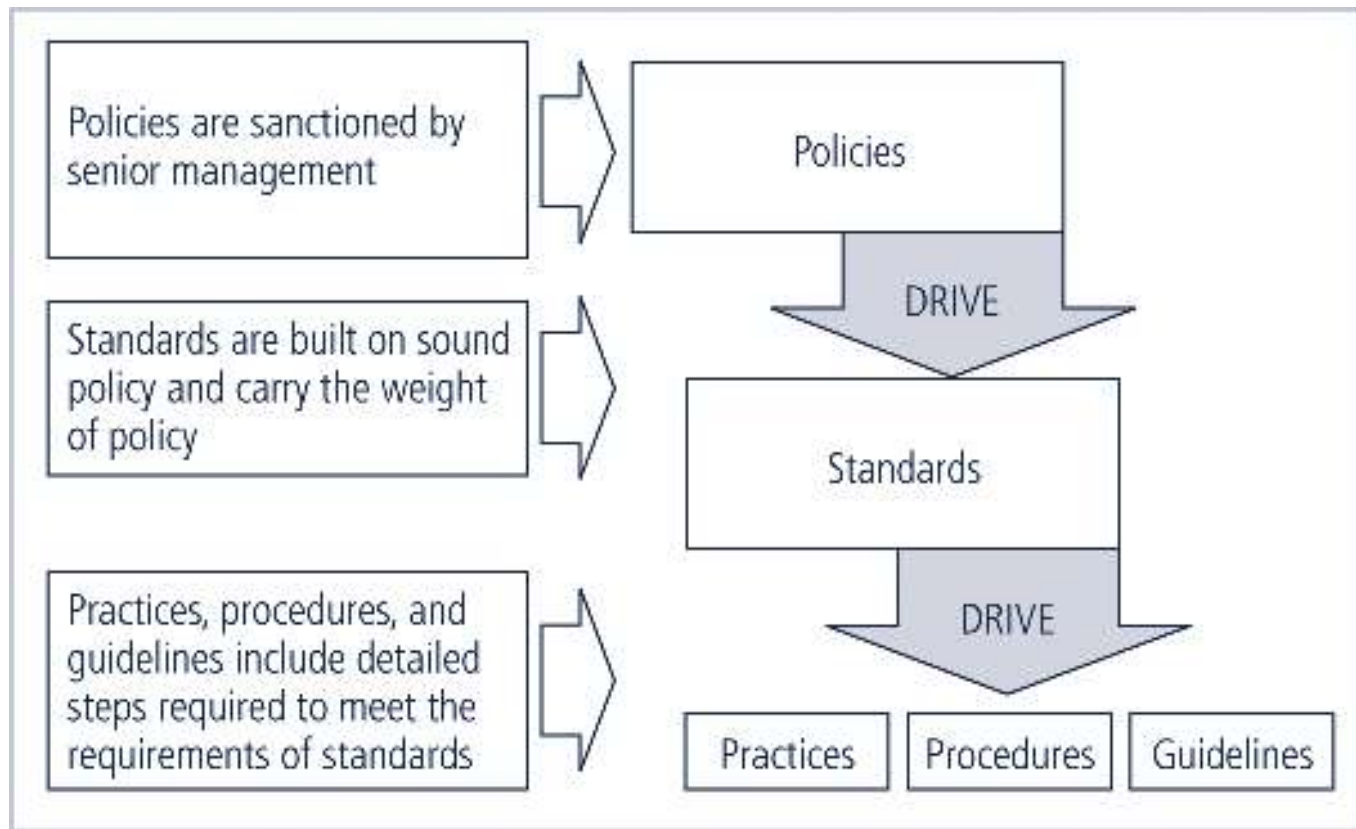

- ⊕ Detail statements of what must be done to comply with policy
- ⊕ Types
  - ⊞ Informal – de facto standards
  - ⊞ Formal – de jure standards

# *Mission/Vision/Strategic Plan*

- ✚ Mission – written statement of organization purpose
- ✚ Vision – written statement of organization goals
- ✚ Strategic Plan - written statement of moving the organization toward its mission

**FIGURE 5-1** Policies, Standards, and Practices

# *Policies*

- ✚ Security Policy – set of rules that protects and organization's assets
- ✚ Information security policy – set of rules that protects an organization's information assets
- ✚ Three types
  - ✚ General Issue-specific
  - ✚ System-specific

## *Enterprise Information Security Policy (EISP)*

- ✚ General Information Security Document
- ✚ Shapes the philosophy of security in IT
- ✚ Executive-level document, usually drafted by or with CIO of the organization, 2-10 pages
- ✚ Typically addresses compliance in two areas
  - ✚ Ensure *meeting requirements* to establish program
  - ✚ *Responsibilities* assigned therein to various organizational components
  - ✚ Use of specified *penalties and disciplinary action*

# *ISSP*

- ✚ Issue-Specific Security Policy
- ✚ Addresses specific areas of technology
- ✚ Requires frequent updates
- ✚ Contains a statement on the organization's position on a specific issue

## *3 Approaches to ISSP*

- ✚ Create independent document tailored to a specific issue
  - ✚ Scattered approach
  - ✚ Departmentalized
- ✚ Create single comprehensive document covering all issues
  - ✚ Centralized management and control
  - ✚ Tend to over generalize the issue
  - ✚ Sip vulnerabilities

## *3 Approaches to ISSP*

- ✚ Create a modular plan
  - ✚ Unified policy creation and administration
  - ✚ Maintain each specific issue's requirements
  - ✚ Provide balance

# *ISSP*

- ⊕ Statement of Policy
- ⊕ Authorization Access & Equipment Use
- ⊕ Prohibited Equipment Use
- ⊕ System Management
  - ⊞ Focus on user's relationship
- ⊕ Violations of Policy
- ⊕ Policy review & modification
- ⊕ Limitations & Liability

## *Systems-Specific Policy (SysSP)*

- ✚ SysSPs frequently codified as standards and procedures
- ✚ used when configuring or maintaining systems
- ✚ Systems-specific policies fall into two groups
  - ✚ Access control lists (ACLs)
  - ✚ Configuration rules

# *ACL Policies*

- ⊕ Restrict access from anyone & anywhere
- ⊕ Can regulate specific user, computer, time, duration, file
- ⊕ What regulated
  - ⊞ Who can use the system
  - ⊞ What authorization users can access
  - ⊞ When authorization users can access
  - ⊞ Where authorization users can access

# *ACL Policies*

- ⊗ Authorization determined by persons identity
- ⊗ Can regulated specific computer equipment
- ⊗ Regulate access to data
  - ⊗ Read
  - ⊗ Write
  - ⊗ Modify
  - ⊗ Copy
  - ⊗ Compare

## *Rule Policies*

- ✚ Rule policies are more specific to operation of a system than ACLs
- ✚ May or may not deal with user directly
- ✚ Many security systems require specific configuration scripts telling systems what actions to perform on each set of information they process

# *Policy Management*

- ⊕ Living documents
- ⊕ Must be managed as they constantly changed and grow
- ⊕ Must be properly disseminated
- ⊕ Must be properly managed
- ⊕ Responsible individual
  - ⊞ Policy administrator
  - ⊞ Champion & manager
  - ⊞ Not necessarily a technically oriented person

# *Reviews*

## ✚ Schedule

- ✚ Retain effectiveness in changing environment
- ✚ Periodically reviewed
- ✚ Should be defined and published
- ✚ Should be reviewed at least annually

## ✚ Procedures and practices

- ✚ Recommendations for change
- ✚ Reality one person draft

# *Document Configuration Management*

- ⊕ Include date of original
- ⊕ Includes date of revision
- ⊕ Include expiration date

## *Information Classification*

- ✚ Classification of information is an important aspect of policy
- ✚ Policies are classified, least for “internal use only”.
- ✚ *A clean desk policy* stipulates that at end of business day, classified information must be properly stored and secured
- ✚ In today’s open office environments, may be beneficial to implement a clean desk policy

# *The Information Security Blueprint*

- ⊗ **Security Blueprint** is the basis for design, selection, and implementation of
  - ⊗ all security policies,
  - ⊗ education and training programs, and
  - ⊗ technological controls
- ⊗ More detailed version of **security framework** (outline of overall information security strategy for organization)
- ⊗ Should specify tasks to be accomplished and the order in which they are to be realized
- ⊗ One approach to selecting a methodology by which to develop an information security blueprint is to **adopt a published model or framework** for information security.

## *ISO 17799/BS7799*

- ⊗ Information technology – code of practice for information security management from
- ⊗ ISO (**International Organization for Standards**)
- ⊗ IEC (**International Electro-technical Commission**)
- ⊗ One of the most widely referenced and often discussed security models
- ⊗ ISO/IEC 17799
  - ⊠ Purpose – “give recommendations for information security management for use by those who are responsible for initiating, implementing, or maintaining security in their organization.
  - ⊠ Provides a common basis
  - ⊠ Must pay for these

## *NIST Security Models*

- ✚ Another possible approach described in documents available from Computer Security Resource Center of **National Institute for Standards and Technology** (NIST)
- ✚ Public ally available at no charge
- ✚ Several publications dealing with various aspects

## *NIST Special Publication 800-14*

- ✦ Security supports mission of organization; is an integral element of sound management
- ✦ Security should be cost-effective; owners have security responsibilities outside their own organizations
- ✦ Security responsibilities and accountability should be made explicit; security requires a comprehensive and integrated approach
- ✦ Security should be periodically reassessed; security is constrained by societal factors
- ✦ 33 Principles enumerated

# *IETF Security Architecture*

- ✚ Internet Engineering Task Force
- ✚ Security Area Working Group acts as advisory board for protocols and areas developed and promoted by the Internet Society
- ✚ *RFC 2196: Site Security Handbook* covers five basic areas of security with detailed discussions on development and implementation

# *VISA International Security Model*

## ✚ VISA Internal

- ✚ Developed two important documents that improve and regulate information systems: “Security Assessment Process”; “Agreed Upon Procedures”
- ✚ Focus on system that can and do integrate with VISA

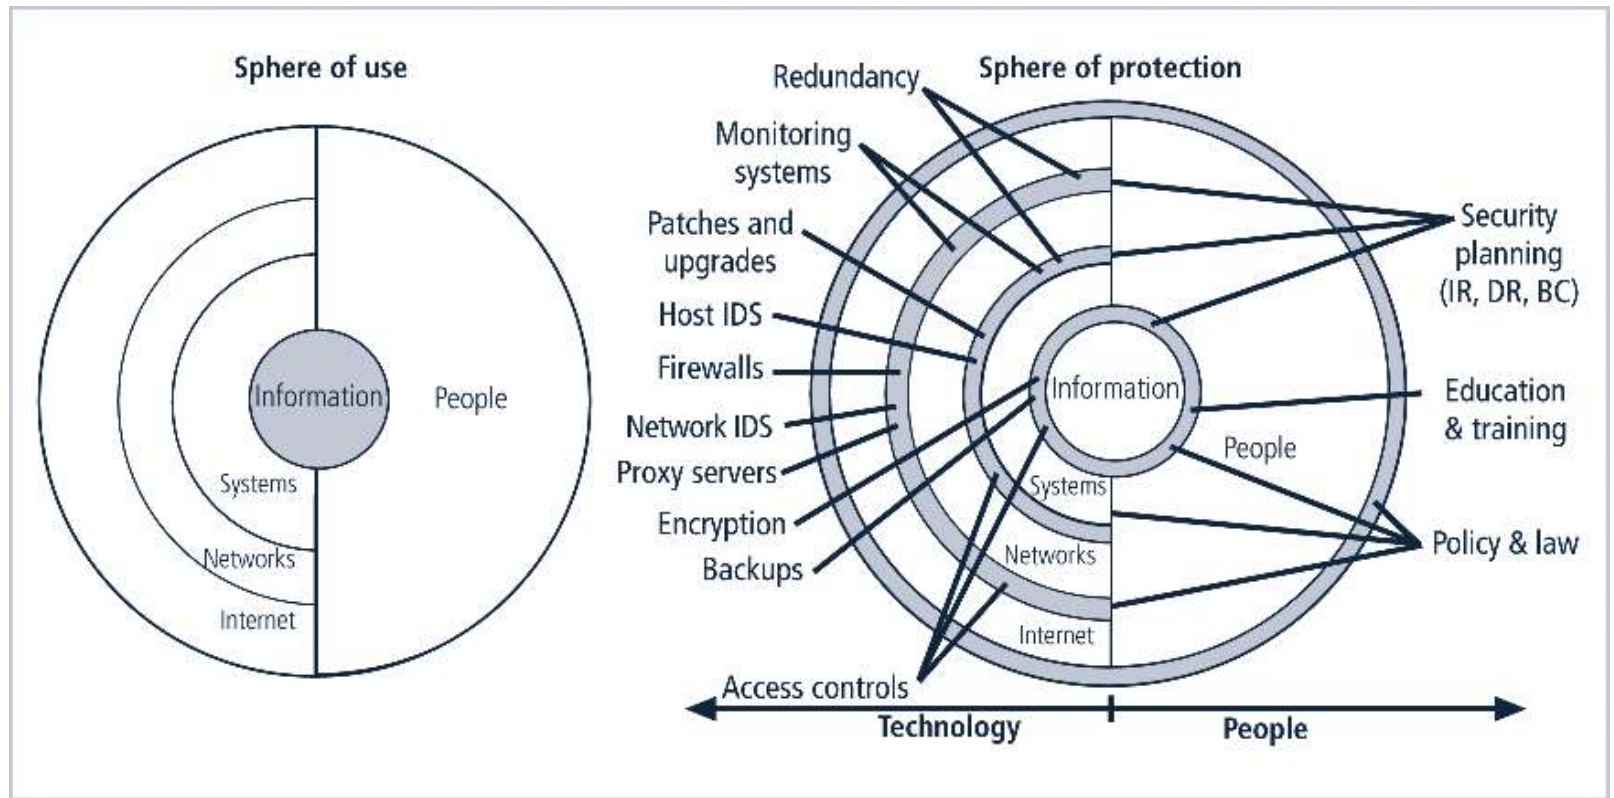

## ✚ Base lining and Best Practices

- ✚ Comparison of your organization security with another

# *Hybrid Framework for a Blueprint of an Information Security System*

- ⊕ Result of a detailed analysis of components of all documents, standards, and Web-based information described previously
- ⊕ Offered here as a balanced introductory blueprint for learning the blueprint development process
- ⊕ People must become a layer of security
- ⊕ Human firewall
- ⊕ Information security implementation
  - ⊕ Policies
  - ⊕ People
    - Education, training, and awareness
    - Technology

**FIGURE 5-15** Spheres of Security

# *Hybrid Framework*

## ✚ Managerial Controls

- ✚ Cover security process
- ✚ Implemented by security administrator
- ✚ Set directions and scope
- ✚ Addresses the design and implementation
- ✚ Addresses risk management & security control reviews
- ✚ Necessity and scope of legal compliance

# *Hybrid Framework*

## ⊕ Operational Controls

- ⊠ Operational functionality of security
- ⊠ Disaster recovery
- ⊠ Incident response planning
- ⊠ Personnel and physical security
- ⊠ Protection of production inputs and outputs
- ⊠ Development of education, training & awareness
- ⊠ Addresses hardware and software system maintenance
- ⊠ Integrity of data

# *Hybrid Framework*

## ✚ Technical Controls

- ✚ Addresses the tactical & technical issues
- ✚ Addresses specifics of technology selection & acquisition
- ✚ Addresses identification
- ✚ Addresses authentication
- ✚ Addresses authorization
- ✚ Addresses accountability

# *Hybrid Framework*

## ✚ Technical Controls

- ✚ Addresses development and implementation of audits
- ✚ Covers cryptography
- ✚ Classification of assets and users

# *Design of Security Architecture*

## ✚ Security Architecture Components

### ✚ Defenses in Depth,

- Implementation of security in layers, policy, training, technology.
- Requires that organization establish sufficient security controls and safeguards so that an intruder faces multiple layers of controls

### ✚ Security Perimeter

- Point at which an organization's security protection ends and outside world begins
- Does not apply to internal attacks from employee threats or on-site physical threats

# *Design of Security Architecture*

## ✚ Security Architecture Components

- ✚ First level of security – protects all internal systems from outside threats
- ✚ Multiple technologies segregate the protected information
- ✚ Security domains or areas of trust

# *Key Technology Components*

## ✚ Firewall

- ✚ Device that selectively discriminates against information flowing in and out
- ✚ Specially configured computer
- ✚ Usually on parameter part of or just behind gateway router

## ✚ DMZ

- ✚ Buffer against outside attacks
- ✚ No mans land between computer and world
- ✚ Web servers often go here

# *Key Technology Components*

## ✚ Proxy Server

- ✚ Performs actions of behalf of another system
- ✚ Configured to look like a web server
- ✚ Assigned the domain name
- ✚ Retrieves and transmits data
- ✚ Cache server

# *Key Technology Components*

## ✚ IDS

### ✚ Intrusion Detection System

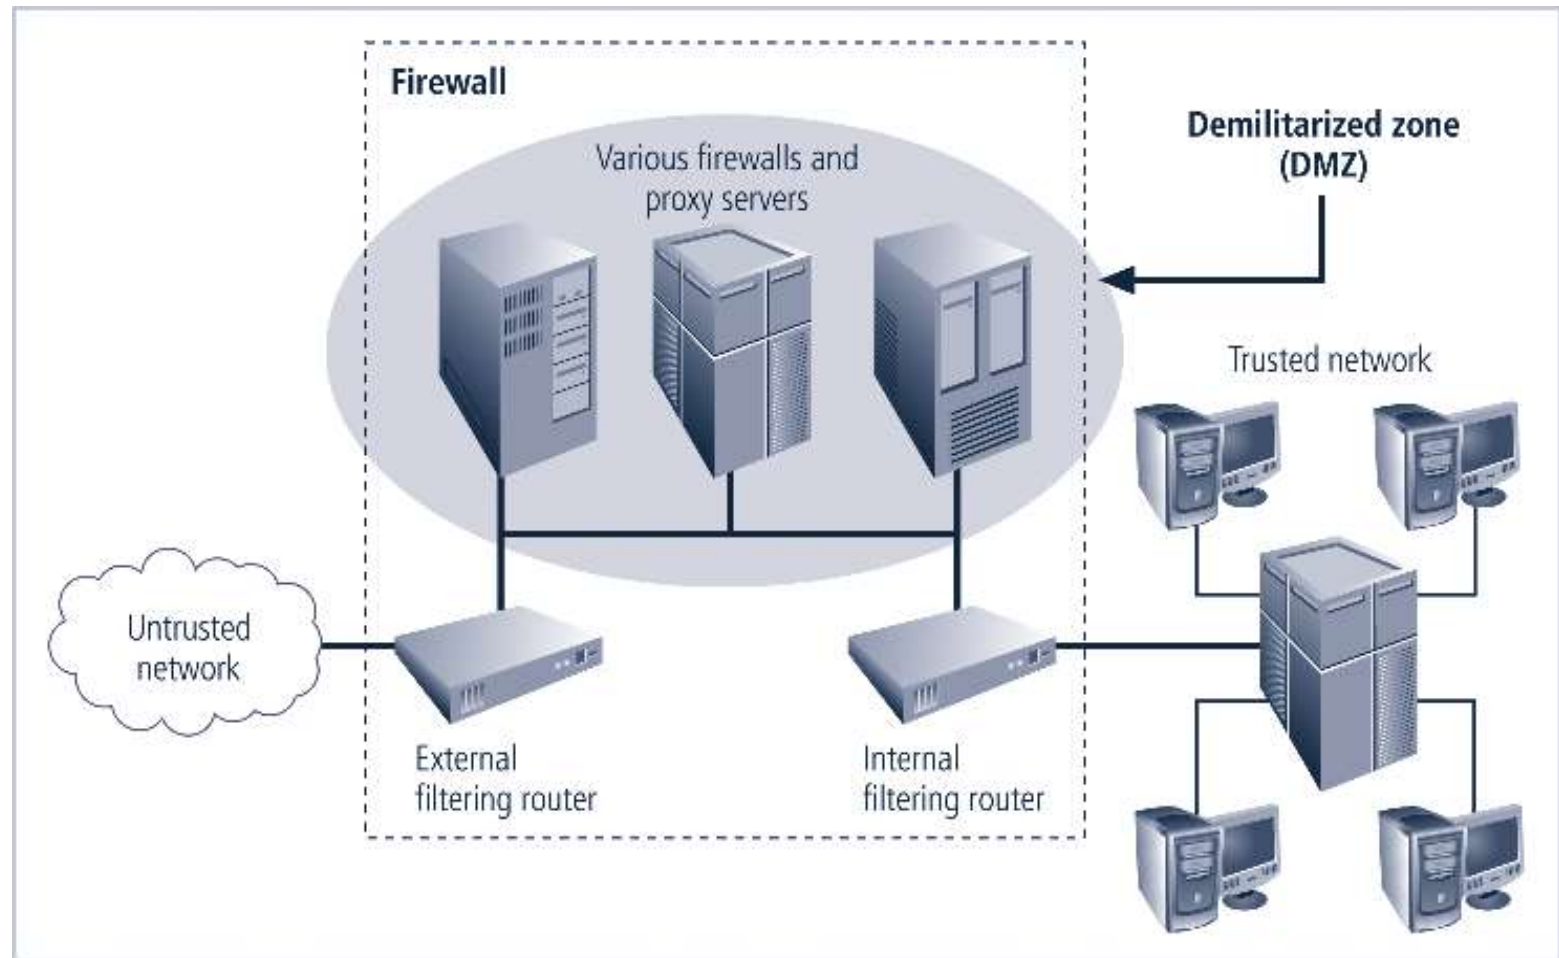

#### ✚ Host based

- Installed on machines they protect
- Monitor host machines

#### ✚ Network based

- Look at patterns of network traffic
- Attempt to detect unusual activity
- Requires database of previous activity
- Uses “machine learning” techniques
- Can use information from similar networks

**FIGURE 5-18** Firewalls, Proxy Servers, and DMZs

# *Key Technology Components*

## ✚ SETA

- ✚ Security education, training and awareness
- ✚ Employee errors among top threats
- ✚ Purpose
  - Improve awareness of need to protect
  - Develop skills and knowledge
  - Build in-depth knowledge to design, implement, or operate security programs

## *Security Education*

- ✚ Everyone in an organization needs to be trained and aware of information security; not every member needs formal degree or certificate in information security
- ✚ When formal education for individuals in security is needed, an employee can identify curriculum available from local institutions of higher learning or continuing education
- ✚ A number of universities have formal coursework in information security

## *Security Training*

- ✚ Involves providing members of organization with detailed information and hands-on instruction designed to prepare them to perform their duties securely
- ✚ Management of information security can develop customized in-house training or outsource the training program

## *Security Awareness*

- ✚ One of least frequently implemented but most beneficial programs is the security awareness program
- ✚ Designed to keep information security at the forefront of users' minds
- ✚ Need not be complicated or expensive
- ✚ If the program is not actively implemented, employees begin to “tune out” and risk of employee accidents and failures increases

# *Continuity Strategies*

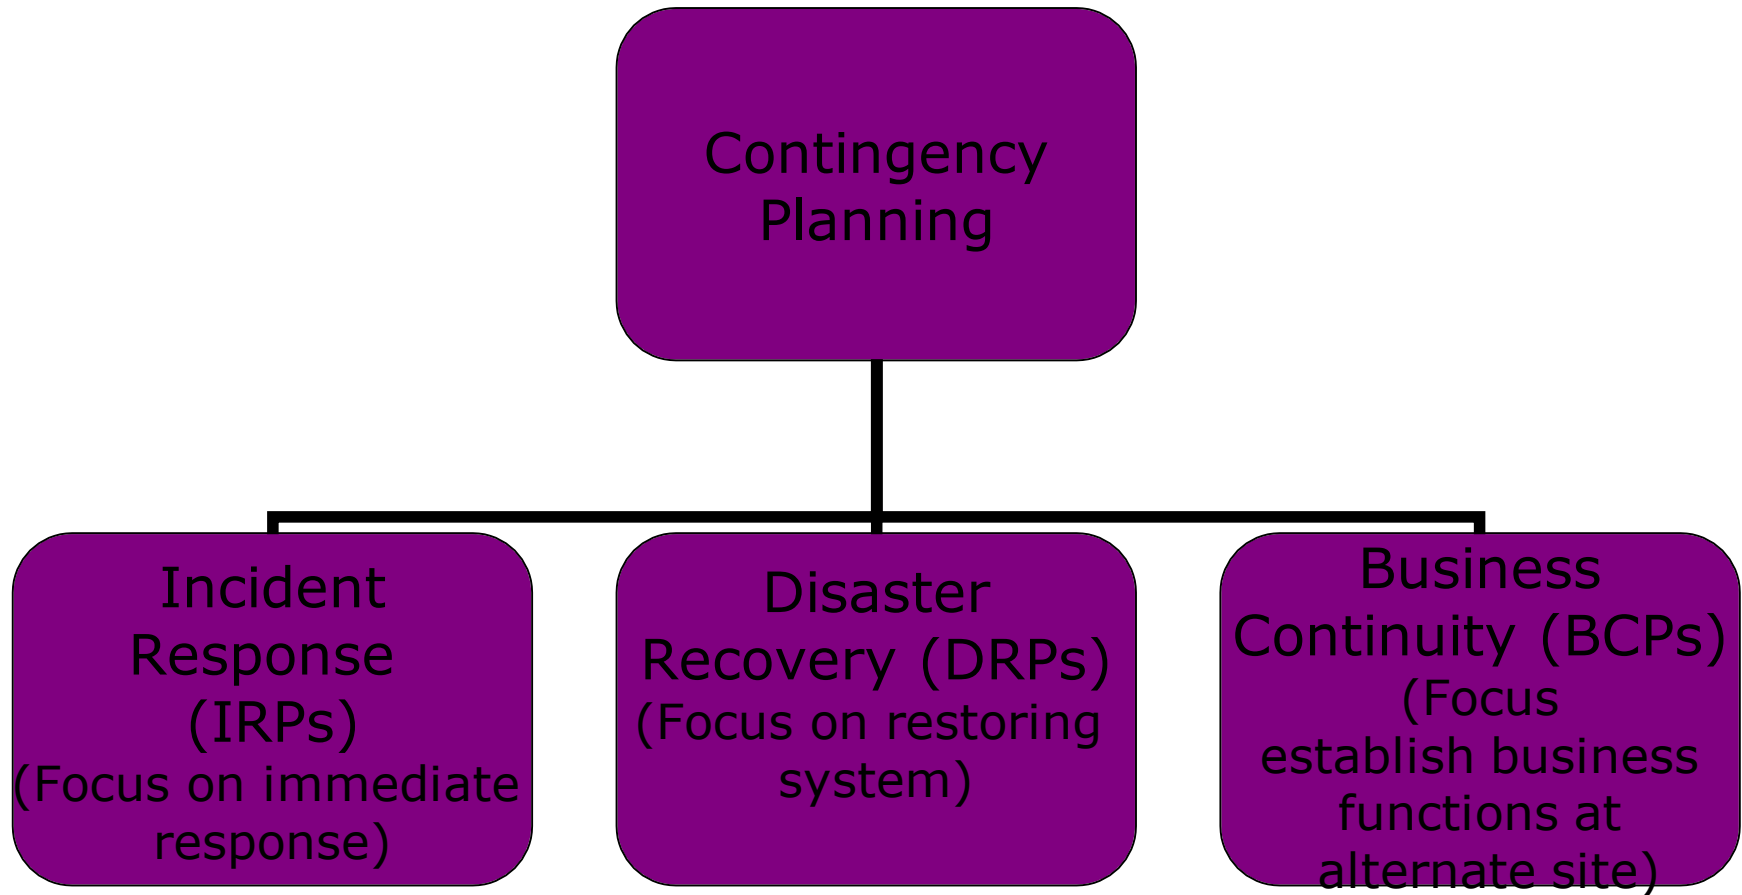

# *Continuity Strategies*

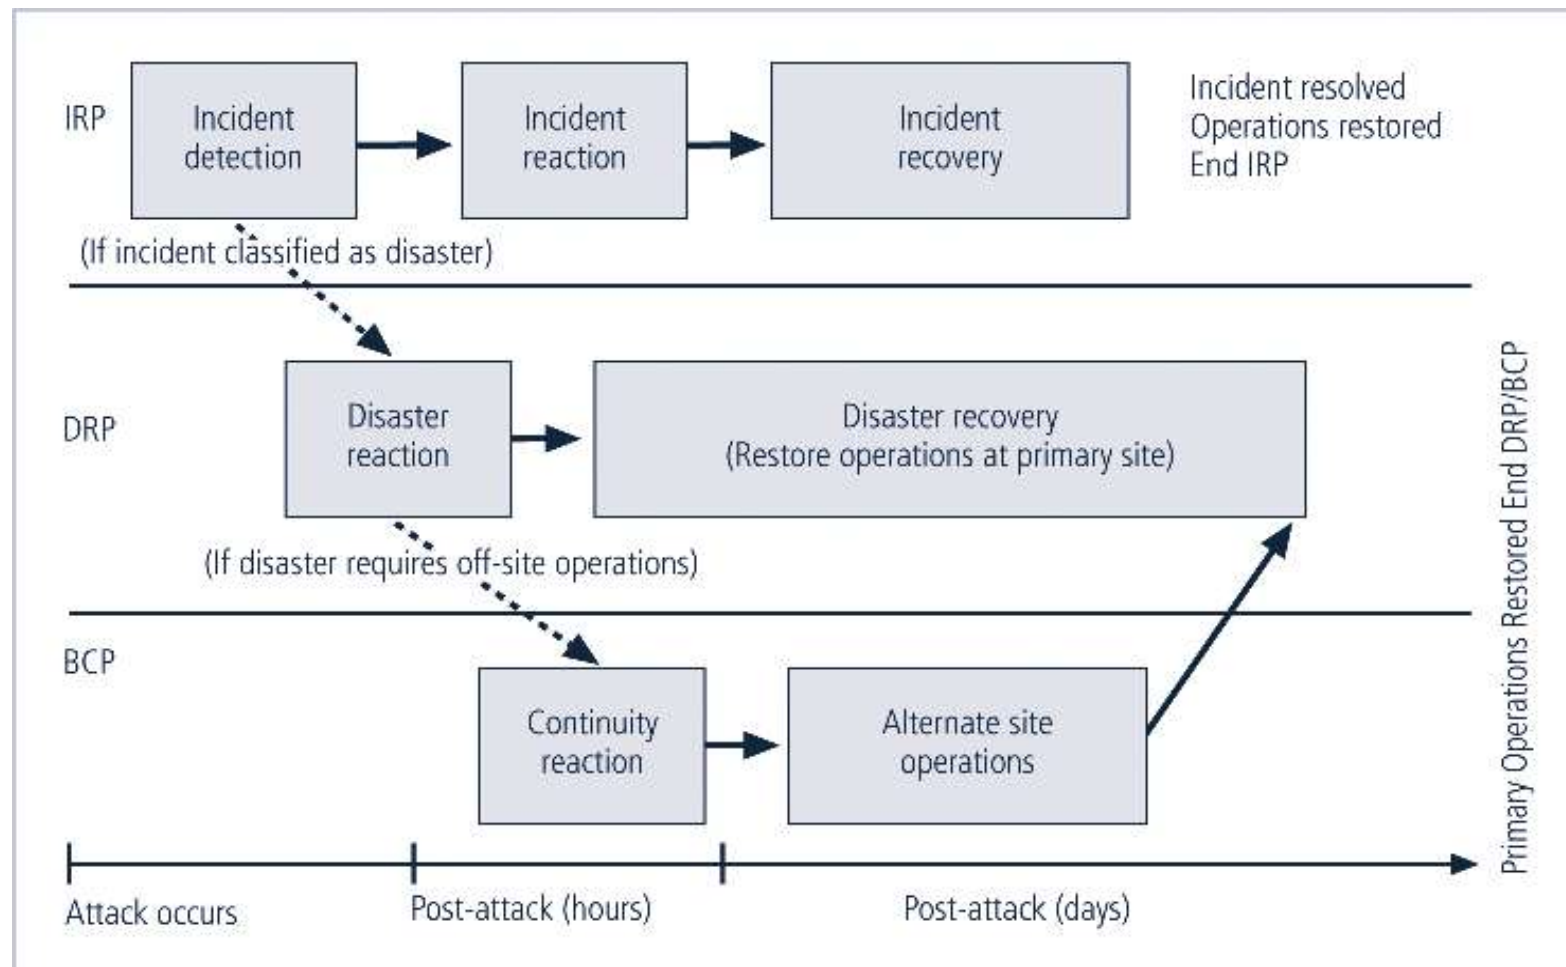

- ✚ Continuous availability of info systems
- ✚ Probability high for attack
- ✚ Managers must be ready to act
- ✚ Contingency Plan (CP)
  - ✚ Prepared by organization
  - ✚ Anticipate, react to, & recover from attacks
  - ✚ Restore organization to normal operations

# *Components of Contingency Plan*

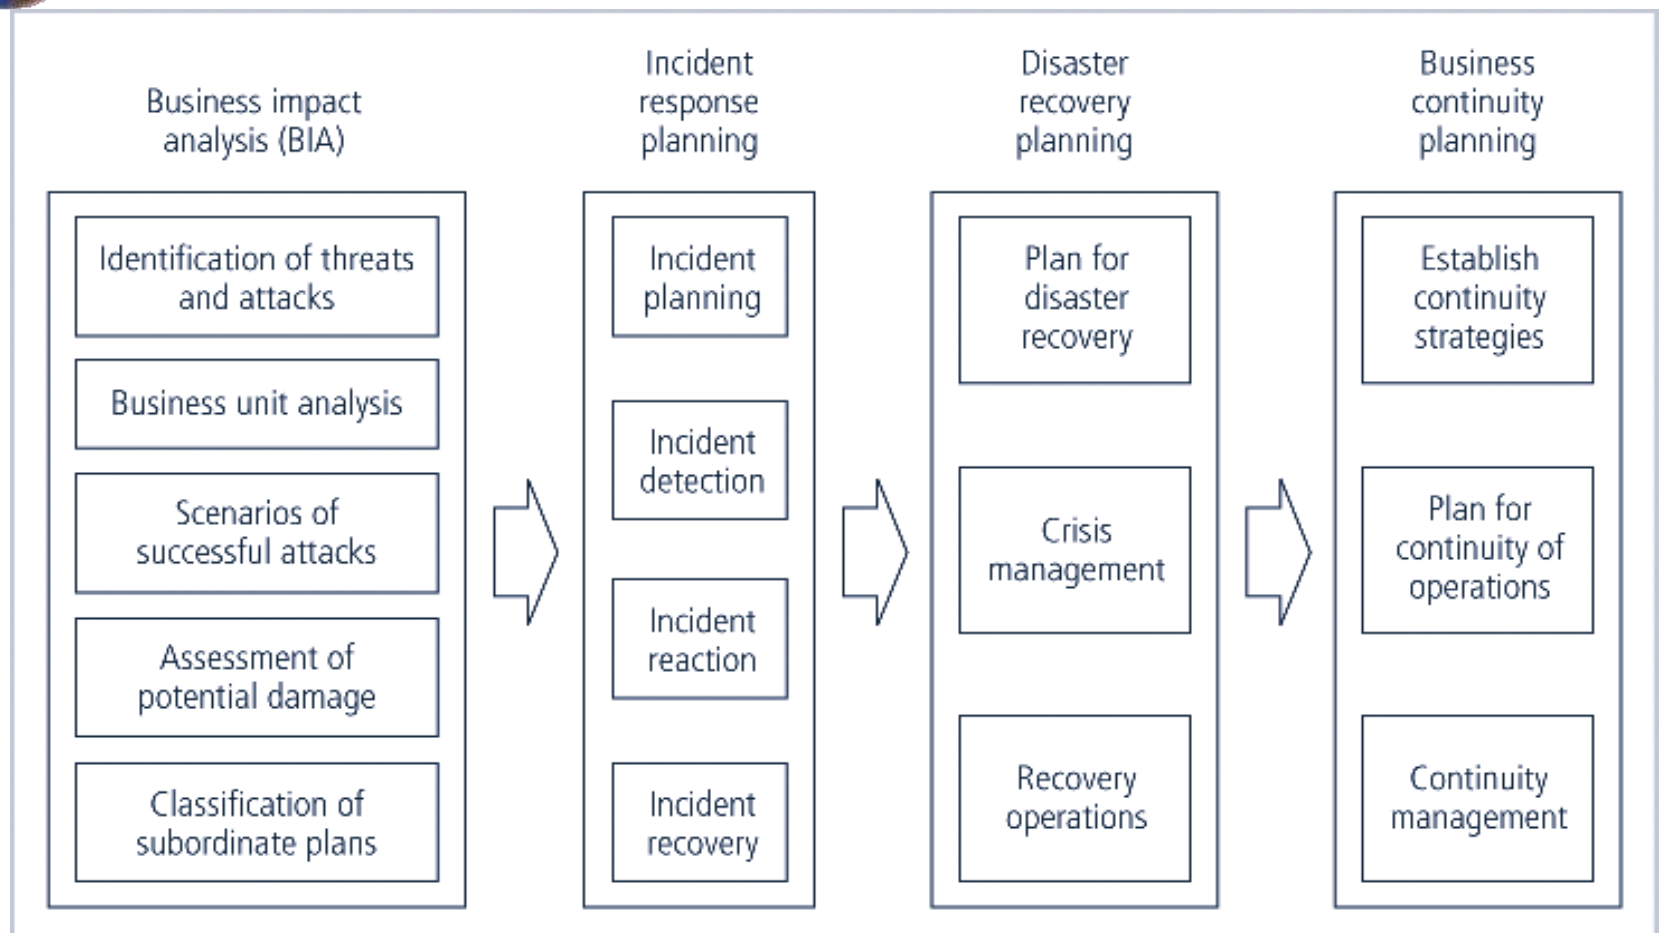

**FIGURE 5-22** Contingency Planning Timeline

## *Continuity Strategies (continued)*

- ✚ Before planning can begin, a team has to plan effort and prepare resulting documents
- ✚ **Champion**: high-level manager to support, promote, and endorse findings of project
- ✚ **Project manager**: leads project and makes sure sound project planning process is used, a complete and useful project plan is developed, and project resources are prudently managed
- ✚ **Team members**: should be managers or their representatives from various communities of interest: business, IT, and information security

**FIGURE 5-23** Major Steps in Contingency Planning

# *Business Impact Analysis (BIA)*

- ✚ Investigate & assess impact of various attack
- ✚ First risk assessment – then BIA
- ✚ Prioritized list of threats & critical info
- ✚ Detailed scenarios of potential impact of each attack
- ✚ Answers question
  - ✚ “if the attack succeeds, what do you do then?”

## *BIA Sections*

- ✚ Threat attack identification & prioritization
  - ✚ Attack profile – detailed description of activities that occur during an attack
  - ✚ Determine the extent of resulting damage
- ✚ Business Unit analysis
  - ✚ Analysis & prioritization-business functions
  - ✚ Identify & prioritize functions w/in orgs units

## *BIA Sections*

- ⊕ Attack success scenario development
  - ⊞ Series of scenarios showing impact
  - ⊞ Each treat on prioritized list
  - ⊞ Alternate outcomes
    - Best, worst, probable cases
- ⊕ Potential damage assessment
  - ⊞ Estimate cost of best, worst, probable
  - ⊞ What must be done under each
  - ⊞ Not how much to spend
- ⊕ Subordinate Plan Classification
  - ⊞ Basis for classification as disastrous not disastrous

## *Incident Response Planning (IRPs)*

- ✚ Incident response planning covers identification of, classification of, and response to an incident
- ✚ Attacks classified as **incidents** if they:
  - ✚ Are directed against information assets
  - ✚ Have a realistic chance of success
  - ✚ Could threaten confidentiality, integrity, or availability of information resources
- ✚ Incident response (IR) is more reactive, than proactive, with the exception of planning that must occur to prepare IR teams to be ready to react to an incident

# *Incident Response*

- ⊗ Set of activities taken to plan for, detect, and correct the impact
- ⊗ Incident planning
  - ⊗ Requires understanding BIA scenarios
  - ⊗ Develop series of predefined responses
  - ⊗ Enables org to react quickly
- ⊗ Incident detection
  - ⊗ Mechanisms – intrusion detection systems, virus detection, system administrators, end users

# *Incident Detection*

## ✚ Possible indicators

- ✚ Presence of unfamiliar files
- ✚ Execution of unknown programs or processes
- ✚ Unusual consumption of computing resources
- ✚ Unusual system crashes

# *Incident Detection*

## ✚ Probable indicators

- ✚ Activities at unexpected times
- ✚ Presence of new accounts
- ✚ Reported attacks
- ✚ Notification from IDS

## ✚ Definite indicators

- ✚ Use of dormant accounts
- ✚ Changes to logs
- ✚ Presence of hacker tools
- ✚ Notification by partner or peer
- ✚ Notification by hackers

# *Incident Detection*

## ⊕ Predefined Situation

- ⊠ Loss of availability
- ⊠ Loss of integrity
- ⊠ Loss of confidentiality
- ⊠ Violation of policy
- ⊠ Violation of law

# *Incident Reaction*

- ⊕ Actions outlined in the IRP
- ⊕ Guide the organization
  - ⊞ Stop the incident
  - ⊞ Mitigate the impact
  - ⊞ Provide information recovery
- ⊕ Notify key personnel
- ⊕ Document incident

# *Incident Containment Strategies*

- ✚ Sever affected communication circuits
- ✚ Disable accounts
- ✚ Reconfigure firewall
- ✚ Disable process or service
- ✚ Take down email
- ✚ Stop all computers and network devices
- ✚ Isolate affected channels, processes, services, or computers

# *Incident Recovery*

- ✚ Get everyone moving and focused
- ✚ Assess Damage
- ✚ Recovery
  - ✚ Identify and resolve vulnerabilities
  - ✚ Address safeguards
  - ✚ Evaluate monitoring capabilities
  - ✚ Restore data from backups
  - ✚ Restore process and services
  - ✚ Continuously monitor system
  - ✚ Restore confidence

## *Disaster Recovery Plan (DRPs)*

- ⊕ Provide guidance in the event of a disaster
- ⊕ Clear establishment of priorities
- ⊕ Clear delegation of roles & responsibilities
- ⊕ Alert key personnel
- ⊕ Document disaster
- ⊕ Mitigate impact
- ⊕ Evacuation of physical assets

# *Crisis Management*

- ⊕ Disaster recovery personnel must know their responses *without any supporting documentation*
- ⊕ Actions taken during and after a disaster *focusing on people involved* and *addressing viability of business*
- ⊕ Crisis management team responsible for managing event from an enterprise perspective and covers:
  - ⊞ Support personnel and loved ones
  - ⊞ Determine impact on normal operations
  - ⊞ Keep public informed
  - ⊞ Communicate with major players such as major customers, suppliers, partners, regulatory agencies, industry organizations, the media, and other interested parties

## *Business Continuity Planning (BCPs)*

- ✚ Outlines **reestablishment** of critical business operations during a disaster that impacts operations
- ✚ If disaster has rendered the business unusable for continued operations, there must be **a plan to allow business to continue functioning**
- ✚ Development of BCP somewhat simpler than IRP or DRP; consists primarily of **selecting a continuity strategy** and integrating off-site data storage and recovery functions into this strategy

## *Continuity Strategies*

- ✚ There are a number of strategies for planning for business continuity
- ✚ Determining factor in selecting between options usually cost
- ✚ In general there are three exclusive options: hot sites; warm sites; and cold sites
- ✚ Three shared functions: time-share; service bureaus; and mutual agreements

# *Alternative Site Configurations*

## ☉ Hot sites

- ☒ Fully configured computer facilities
- ☒ All services & communication links
- ☒ Physical plant operations

## ☉ Warm sites

- ☒ Does not include actual applications
- ☒ Application may not be installed and configured
- ☒ Required hours to days to become operational

## ☉ Cold sites

- ☒ Rudimentary services and facilities
- ☒ No hardware or peripherals
- ☒ empty room

# *Alternative Site Configurations*

## ⊕ Time-shares

- ⊞ Hot, warm, or cold
- ⊞ Leased with other orgs

## ⊕ Service bureau

- ⊞ Provides service for a fee

## ⊕ Mutual agreements

- ⊞ A contract between two or more organizations that specifies how each will assist the other in the event of a disaster.

# *Off-Site Disaster Data Storage*

- ✚ To get sites up and running quickly, organization must have ability to port data into new site's systems
- ✚ Electronic vaulting
  - ✚ Transfer of large batches of data
  - ✚ Receiving server archives data
  - ✚ Fee
- ✚ Journaling
  - ✚ Transfer of live transactions to off-site
  - ✚ Only transactions are transferred
  - ✚ Transfer is real time

# *Off-Site Disaster Data Storage*

## ✚ Shadowing

- ✚ Duplicated databases
- ✚ Multiple servers
- ✚ Processes duplicated
- ✚ 3 or more copies simultaneously

# *Model For a Consolidated Contingency Plan*

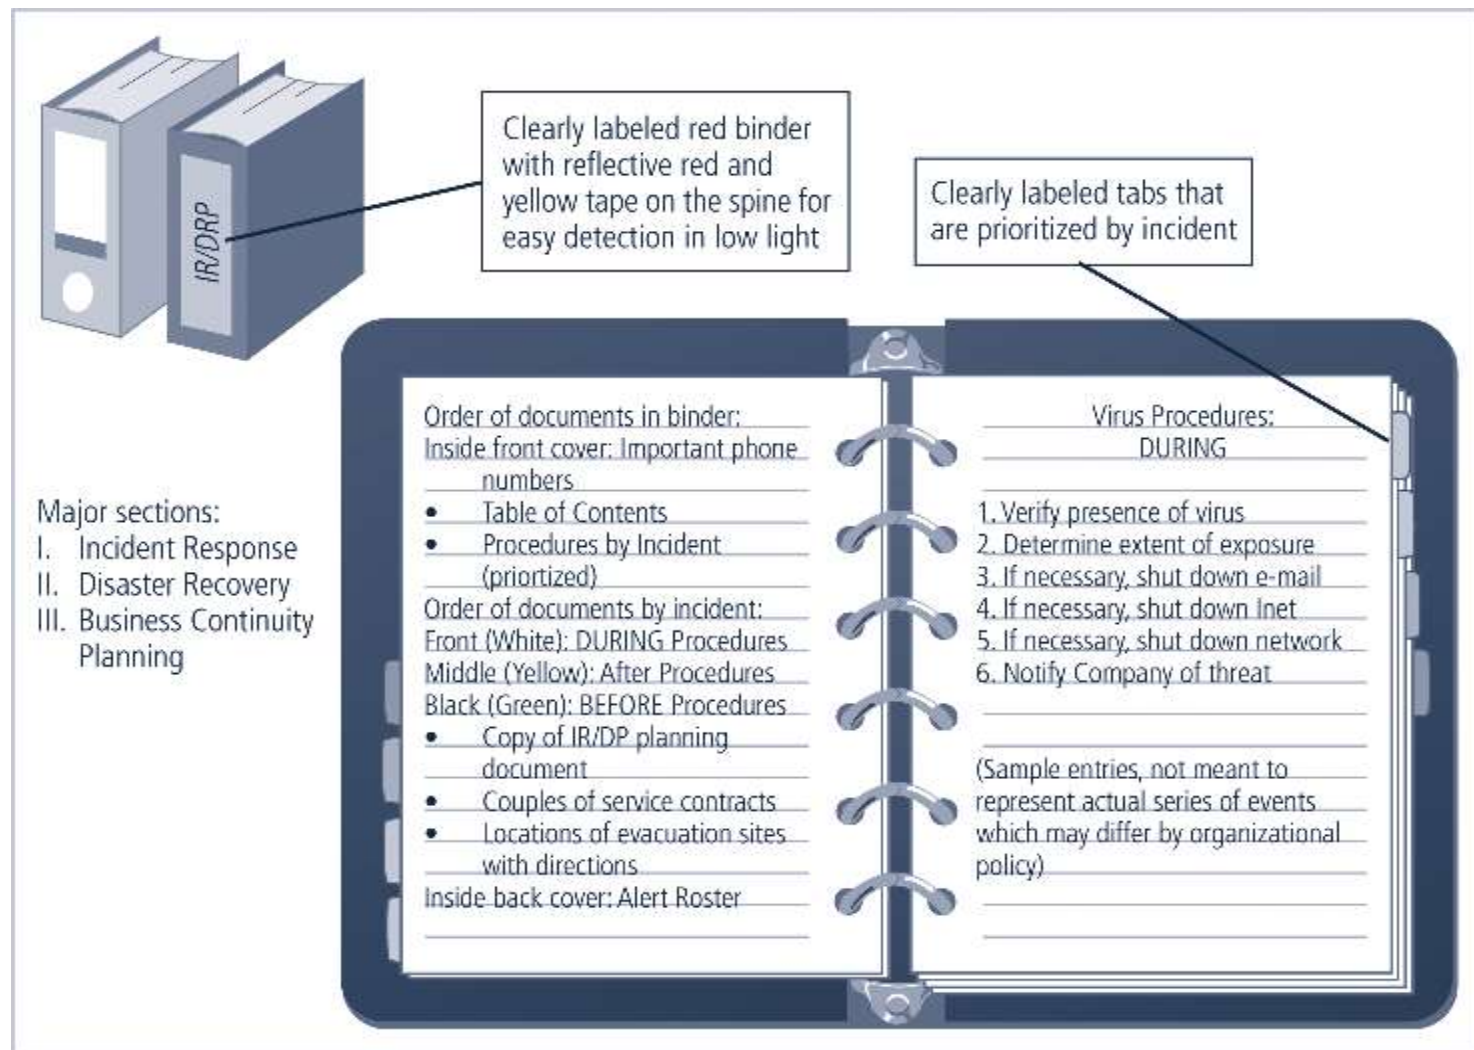

- ✚ Single document set supports concise planning and encourages smaller organizations to develop, test, and use IR and DR plans
- ✚ Model is based on analyses of disaster recovery and incident response plans of dozens of organizations

# *The Planning Document*

- ✚ Six steps in contingency planning process
  - ✚ Identifying mission- or business-critical functions
  - ✚ Identifying resources that support critical functions
  - ✚ Anticipating potential contingencies or disasters
  - ✚ Selecting contingency planning strategies
  - ✚ Implementing contingency strategies
  - ✚ Testing and revising strategy

**FIGURE 5-24** Contingency Plan Format

## *Law Enforcement Involvement*

- ✚ When incident at hand constitutes a violation of law, organization may determine involving law enforcement is necessary
- ✚ Questions:
  - ✚ When should organization get law enforcement involved?
  - ✚ What level of law enforcement agency should be involved (local, state, federal)?
  - ✚ What happens when law enforcement agency is involved?
- ✚ Some questions are best answered by organization's legal department

# *Benefits and Drawbacks of Law Enforcement Involvement*

- ⊕ Involving law enforcement agencies has **advantages**:
  - ⊗ Agencies may be better equipped at processing evidence
  - ⊗ Organization may be less effective in convicting suspects
  - ⊗ Law enforcement agencies prepared to handle warrants and subpoenas needed
  - ⊗ Law enforcement skilled at obtaining witness statements and other information collection

# *Benefits and Drawbacks of Law Enforcement Involvement (continued)*

- ✚ Involving law enforcement agencies has **disadvantages**:
  - ✚ Once a law enforcement agency takes over case, organization loses complete control over chain of events
  - ✚ Organization may not hear about case for weeks or months
  - ✚ Equipment vital to the organization's business may be tagged evidence
  - ✚ If organization detects a criminal act, it is legally obligated to involve appropriate law enforcement officials

## *Summary*

- ⊕ Management has essential role in development, maintenance, and enforcement of information security policy, standards, practices, procedures, and guidelines
- ⊕ Information security blueprint is planning document that is basis for design, selection, and implementation of all security policies, education and training programs, and technological controls

## *Summary*

- ✚ Information security education, training, and awareness (SETA) is control measure that reduces accidental security breaches and increases organizational resistance to many other forms of attack
- ✚ Contingency planning (CP) made up of three components: incident response planning (IRP), disaster recovery planning (DRP), and business continuity planning (BCP)
